

Lesson 48 Practice: Answers and Rationales

JKSSB Computer Awareness

October 8, 2026

Provenance: All 20 items are original JKSSB-pattern questions (*[Original]*); none reproduces an official paper item.

- Q1. A.** ISP stands for Internet Service Provider. B, C, and D are not expansions of the abbreviation.
- Q2. A.** RAM is volatile and loses its contents when power goes off. ROM (B), the hard disk drive (C), and magnetic tape (D) are all non-volatile.
- Q3. A.** F5 starts the slide show from the beginning. F7 (B) runs spell check; F9 and F2 (C, D) do not start the show.
- Q4. A.** A formula must start with =. The other symbols (B, C, D) do not mark a formula.
- Q5. A.** The bit is the smallest unit of data. A byte (B) is 8 bits; a nibble (C) is 4 bits; a kilobyte (D) is far larger.
- Q6. A.** Mail Merge combines letters with an address database. Track Changes (B) records edits; AutoCorrect (C) fixes typing; Word Count (D) counts words.
- Q7. A.** @ separates the user name from the domain name. B, C, and D describe separations @ does not perform.
- Q8. A.** The BIOS initialises hardware and loads the OS. A device driver (B) is software that controls a device; a compiler (C) and an assembler (D) translate code.
- Q9. A.** POP3 stands for Post Office Protocol version 3. B, C, and D are not the correct full form.
- Q10. A.** G2C means Government to Citizen. B, C, and D are not the recognised expansion.
- Q11. C.** A device driver is software, not hardware, so this statement is the false one. Cache being faster than RAM (A), RAM being volatile (B), and F5 starting the show (D) are all true.
- Q12. A.** Speed decreases from registers to cache to main memory (RAM) to secondary storage. B swaps the top two levels; C and D scramble the order.
- Q13. D.** A digitizer tablet captures strokes, so it is an input device. A wrongly calls the plotter input (it is output); B wrongly calls the sound card input (it is output); C wrongly calls the scanner output (it is input).
- Q14. A.** Only a Section Break restarts headers and footers. A Page Break (B) merely starts a new page; Line Break (C) and Column Break (D) do not restart headers.

- Q15. A.** POP3 downloads mail to the local machine while IMAP keeps mail synced on the server. B reverses the two; C and D are false for both protocols.
- Q16. A.** Encryption provides confidentiality while a digital signature provides authenticity and integrity. B swaps the two roles; C conflates them; D is false.
- Q17. A.** In IaaS the provider manages infrastructure (networking and storage hardware) and the customer manages OS, runtime, apps, and data. B reverses the split; C and D misstate the model.
- Q18. A.** Statements I and II are correct: IPv6 is 128-bit and BGP is inter-domain. III is false because HTTP/3 uses QUIC over UDP, not TCP. B includes false III and omits I; C includes false III; D omits II.
- Q19. A.** COUNTIFS with two range-criterion pairs counts rows meeting both conditions in one step. COUNT (B) counts numbers only; SUM plus COUNT (C) and AVERAGE (D) do not apply joint conditions.
- Q20. A.** The stated bottleneck is single-threaded execution plus memory or disk waits, so threading and memory/disk I/O should be checked first. Replacing the CPU (B) ignores the stated waits; C and D are unrelated to the bottleneck.
