

Internet, WWW & Browser

Lesson 34 — The Web and Its Access Tools

JKSSB Computer Awareness

October 8, 2026

What the Internet Is

- ▶ The **Internet** is a global network of connected computers and networks.
- ▶ It is a **network of networks**: smaller networks joined together so any connected device can reach any other.
- ▶ It carries many services — the Web, e-mail, file transfer, and more.
- ▶ The Internet is the **physical infrastructure**: cables, routers, servers, and the devices connected to them.

The one idea

The Internet is the network itself; the services that run on it, such as the Web and e-mail, are not the same thing as the Internet.

Internet vs WWW

Point	Internet	WWW (World Wide Web)
What it is	Global network of networks	A service running on the Internet
Content	Carries all services	Linked web pages and sites
Access	Via an ISP connection	Via a browser over the Internet

Trap alert

The Internet and the Web are **not** the same. The **WWW — World Wide Web** — is one service that uses the Internet.

Website vs Webpage vs Homepage

- ▶ A **webpage** is a single document on the Web, shown in a browser.
- ▶ A **website** is a collection of related webpages under one address (domain).
- ▶ The **homepage** is the main or starting page of a website.
- ▶ Order of size: **homepage** (one page) → **webpage** (any one page) → **website** (the whole collection).

Keep the three straight

One page is a webpage; the whole collection is a website; the front door of that collection is the homepage.

What a Browser Is

- ▶ A **browser** is software used to open and view websites and webpages.
- ▶ It sends a request for a page and displays the page that comes back.
- ▶ Common browsers: **Google Chrome, Mozilla Firefox, Microsoft Edge, Apple Safari.**
- ▶ A browser is **software on the user's device** — it is not the Internet itself.

Office desktop example

On the office desktop, double-clicking the Chrome icon opens a browser; typing an address then loads that site's homepage.

What a Search Engine Is

- ▶ A **search engine** is a website (service) that finds other webpages matching typed keywords.
- ▶ Examples: **Google**, **Bing**, **Yahoo**.
- ▶ It is **reached through** a browser — the browser is the tool, the search engine is the site visited with it.
- ▶ Searching needs both: a browser open on the device, and a search-engine site loaded inside it.

Browser vs Search Engine

Point	Browser	Search engine
What it is	Software (application)	A website / service
Role	Opens and displays pages	Finds pages for keywords
Examples	Chrome, Firefox, Edge, Safari	Google, Bing, Yahoo

Trap alert

Chrome is a **browser**; Google is a **search engine**. Swapping the two is a common wrong answer.

Client

- ▶ A **client** is the device or program that requests a service or resource.
- ▶ The office PC's browser asking for a webpage is acting as a client.
- ▶ A client **asks**; it does not supply the page itself.
- ▶ Client and server always appear as a pair: one requests, the other serves.

The one idea

Client = the requester; server = the supplier.

Server

- ▶ A **server** is a computer (or program) that supplies services or resources to clients.
- ▶ A **web server** stores websites and sends pages to browsers that ask for them.
- ▶ One server can serve **many clients** at the same time.
- ▶ Servers stay **switched on and connected** so clients can reach them at any time.

Client and Server Together

- ▶ Step 1: the **client** (browser) sends a request for a page.
- ▶ Step 2: the **server** receives the request and sends the page back.
- ▶ Step 3: the browser **displays** the received page.
- ▶ This request-and-response pair is the **client-server** model of the Web.

Worked example

Typing a site address and pressing Enter sends a request; the site's server returns the homepage, which the browser shows.

ISP: Internet Service Provider

- ▶ **ISP** stands for Internet Service Provider.
- ▶ It is the company or organisation that **provides the Internet connection** to homes and offices.
- ▶ Without an ISP connection, the device cannot reach the Internet at all.
- ▶ The ISP link comes **before** everything else: no ISP, no browsing, no search, no e-mail.

Exam fact (PYQ-34)

ISP = **Internet Service Provider** (WO 2026 Q74). Do not expand it as anything else.

Hyperlink

- ▶ A **hyperlink** (link) is clickable text or an image that jumps to another page or section.
- ▶ Clicking it loads the **linked webpage**, which may sit on the same site or a different one.
- ▶ Links are what make the Web a “web” — pages joined to pages.
- ▶ A hyperlink points the way; the browser follows it when clicked.

Keep the pair straight

A hyperlink **points** to a page; a browser **opens** it.

Full-Form Ladder of This Lesson

Short form	Full form	One-line role
ISP	Internet Service Provider	Gives the Internet connection
WWW	World Wide Web	Linked pages and sites
URL	Uniform Resource Locator	Address of a page or resource
HTTP	HyperText Transfer Protocol	Rules for requesting pages
HTML	HyperText Markup Language	Language webpages are written in

Give the full form on first mention; direct-recall items ask the expansion exactly.

URL and Homepage Address

- ▶ A **URL — Uniform Resource Locator** — is the address of a webpage or resource on the Web.
- ▶ Typing the site's URL in the browser's **address bar** loads its homepage.
- ▶ Each webpage of a website has **its own URL**; the homepage URL is the site's base address.
- ▶ The URL names the page; the hyperlink jumps to it.

Trap Alert: Web Facts to Keep Straight

- ▶ Internet $\neq$ WWW: the Web is **one service** on the Internet.
- ▶ Browser $\neq$ search engine: Chrome is a **browser**; Google is a **search engine**.
- ▶ Website $\neq$ webpage: the site is the **collection**; a webpage is **one document**; the homepage is the **first page**.
- ▶ Client **requests**; server **supplies**. (PYQ-34: ISP = Internet Service Provider.)
- ▶ A hyperlink **points**; only clicking (via the browser) follows it.

Lesson 34: Recall

- ▶ The Internet is the global network of networks; the WWW — World Wide Web — is a service running on it.
- ▶ A webpage is one document; a website is the collection; the homepage is the main page.
- ▶ A browser (Chrome, Firefox, Edge, Safari) opens pages; a search engine (Google, Bing, Yahoo) finds pages.
- ▶ The client requests and the server supplies; the ISP — Internet Service Provider — gives the connection.
- ▶ A hyperlink jumps to another page; a URL — Uniform Resource Locator — is a page's address.
- ▶ Full forms: ISP, WWW, URL, HTTP, HTML — learn each expansion exactly.
