

PowerPoint Animation & Transition

Lesson 32 — Effects and the Slideshow Keys

JKSSB Computer Awareness

October 8, 2026

Animation and Transition: The Core Difference

- ▶ **Animation** is an effect applied to **one object or text inside a slide**.
- ▶ **Transition** is an effect applied to the movement **from one slide to the next**.
- ▶ Both are added from the **Animations** and **Transitions** tabs.
- ▶ They control **how things move**, not the content itself.

The one idea

Animation works **within** a slide; a transition works **between** slides. Keep the two words apart.

What an Animation Applies To

- ▶ An animation can be set on text, bullet points, pictures, shapes, charts, tables, and SmartArt.
- ▶ It can start **when the slide appears** or **on a mouse click**.
- ▶ Timing, duration, and order are controlled from the **Animation Pane**.
- ▶ Animation does not change the position of the slide in the deck; that is a transition's job.

The Four Animation Effect Categories

Effect	What it does
Entrance	Makes an object appear on the slide.
Exit	Makes an object leave the slide.
Emphasis	Draws attention to an object that is already visible .
Motion Path	Moves an object along a defined path .

Entrance and Exit change whether the object is on the slide; Emphasis changes how the object behaves; Motion Path changes where it travels.

Entrance versus Exit

Entrance

- ▶ Brings an object **onto** the slide.
- ▶ Used to reveal content step by step.

Exit

- ▶ Takes an object **off** the slide.
- ▶ Used to clear content before the next point.

Near-neighbour alert

Entrance and Exit are opposites. An effect that makes an object stay and simply stand out is **Emphasis**, not Entrance.

Emphasis and Motion Path

- ▶ **Emphasis**: the object stays on the slide and is highlighted — for example a grow, spin, or colour pulse.
- ▶ **Motion Path**: the object travels from one place to another along a drawn line, such as a straight line or a curve.
- ▶ A motion path changes an object's **position** during the show.
- ▶ Both belong to the **Animations** tab, not to Transitions.

Quick check

“The logo flies in from the left and settles into the corner” describes a **Motion Path**;
“the logo spins once and stops” describes **Emphasis**.

Transitions: Slide to Slide

- ▶ A **transition** plays as the presentation moves from the **current slide to the next**.
- ▶ Standard transitions include **Fade**, **Push**, **Wipe**, and **Dissolve**.
- ▶ A transition can be set with a **duration** and an optional **sound**.
- ▶ Transitions are managed on the **Transitions** tab and can be applied to one slide or to all slides.

Applying to all slides

The **Apply To All** button copies the chosen transition to every slide in the presentation.

Transition Groups

Group	Character
Subtle	Gentle, professional changes such as Fade and Wipe.
Exciting	Stronger movement such as Push, Cover, and Split.
Dynamic Content	Motion that responds to the slide content itself.

Transitions of the same group look consistent; mixing groups can make a deck look uneven.

The Morph Transition

- ▶ **Morph** is a modern transition that **smoothly moves and animates** objects as one slide changes into the next.
- ▶ It works best when two slides share **similar objects** — for example the same picture in two positions.
- ▶ Morph then makes those objects appear to **glide** into their new places.
- ▶ Morph is a **transition**, so it is set on the Transitions tab.

Worked example

Slide 1 shows a circle on the left; slide 2 shows the same circle on the right. With **Morph**, the circle appears to slide smoothly across, instead of jumping.

Starting the Slide Show: F5

- ▶ **F5** starts the slide show **from the beginning** — from the first slide.
- ▶ **Shift+F5** starts the slide show **from the current slide** — the one selected.
- ▶ **Alt+F5** starts the presentation in **Presenter View**.
- ▶ **Esc ends** a running slide show.

Real PYQ (WO 2026 Q80)

“Slide show from the beginning” is **F5**. This exact pairing has appeared in the official paper.

The Slideshow Key Set

Key	Action during a slide show
F5	Start from the beginning .
Shift+F5	Start from the current slide.
Alt+F5	Start in Presenter View .
Esc	End the slide show.

Learn this table as a set; exam items often swap F5 and Shift+F5.

More Controls While Presenting

- ▶ **N**, **Enter**, **Space**, or **Right Arrow**: go to the **next** slide or animation.
- ▶ **P** or **Left Arrow**: go back to the **previous** slide.
- ▶ **B**: turn the screen **black**; **W**: turn it **white**.
- ▶ Type a slide number and press **Enter** to jump to that slide.

Presenter View

Presenter View shows the current slide, the **next** slide, the **speaker notes**, and a timer — all on the presenter's screen.

Speaker Notes

- ▶ The **Notes pane** sits below the slide in Normal view.
- ▶ It holds **speaker notes** — reminders the presenter reads while presenting.
- ▶ Notes are **not shown** on the projected slide during a normal slide show.
- ▶ In **Presenter View**, the notes are visible only to the presenter.

PowerPoint Views

View	Purpose
Normal	Edit one slide with an outline and the notes pane.
Outline	Work with the text of all slides as an outline.
Slide Sorter	See thumbnails of all slides and reorder them.
Notes Page	View and print a slide with its speaker notes.
Reading View	Review the show in a window without full screen.
Slide Show	Present the deck full screen.

Slide Sorter is the view for rearranging slides; Notes Page is the view for notes with the slide.

Handouts

- ▶ A **handout** prints the presentation for the **audience**.
- ▶ Handouts usually place **several slides on one page** — two, three, four, six, or nine per page.
- ▶ Handout layouts can include **lined space** for the audience to write notes.
- ▶ Speaker notes are for the **presenter**; a handout is for the **audience**.

Do not confuse them

Notes pane = **presenter**. Handout = **audience**. They are different outputs.

SmartArt Conversion and Its Limits

- ▶ A **SmartArt** graphic can be converted to **shapes** or to **text**.
- ▶ **Convert to Text** turns the graphic into a **plain bulleted list**: the graphical layout is lost.
- ▶ **Convert to Shapes** keeps individual shapes but removes the SmartArt arrangement, so it cannot be turned back into SmartArt.
- ▶ Content that depended on the layout must be **re-entered** or re-applied by hand.

Preview of a real PYQ

The JA 2026 paper tested which SmartArt content **cannot** convert cleanly without re-entry (PYQ-17). Remember: the **design and layout** are what a text conversion drops.

Trap Alert: F5 versus F7 versus F9

- ▶ **F5** starts the slide show from the beginning.
- ▶ **Shift+F5** starts from the current slide.
- ▶ **Alt+F5** starts Presenter View.
- ▶ **F7** is the **spelling and grammar** check — not the slide show (TRAP-32).
- ▶ **Esc** ends the show.

The trap

Do not choose F7 or F9 for “start the slide show”. F5 is the show; F7 is spell check.

Lesson 32: Recall

- ▶ **Animation** acts on an object **within** a slide; **transition** acts **between** slides.
- ▶ Four animation effects: **Entrance**, **Exit**, **Emphasis**, **Motion Path**.
- ▶ **Morph** is a transition that smoothly moves matching objects across slides.
- ▶ Show keys: **F5** = beginning, **Shift+F5** = current, **Alt+F5** = Presenter View, **Esc** = end.
- ▶ **Notes pane** = presenter; **handout** = audience; **Slide Sorter** = reorder slides.
- ▶ **SmartArt** converted to text loses its graphical layout.
