

Office Shortcut & Product Trap Lab

Lesson 54 — Exact Keys and Product-Category Traps

JKSSB Computer Awareness

October 8, 2026

This Lesson Is a Trap Drill

- ▶ The JKSSB computer section tests **exact keys** and **exact product categories**, not vague recognition.
- ▶ A wrong option is usually the **nearest neighbour** — the key or product that “sounds right”.
- ▶ In this lesson every question is built around a real near-neighbour or defective-option pattern.
- ▶ **Read each option as a claim to be tested**, not merely as a phrase to recognise.
- ▶ Preserve the exact English term: F5, F7, Ctrl+H, \$A\$1.

Trap drill

Same key, different program, different job — and the same product name placed in the wrong software category.

MS Word: Exact Shortcut Keys

Shortcut	Action in MS Word
F7	Spelling & Grammar (spell check)
Shift+F7	Thesaurus
Ctrl+H	Find and Replace
Ctrl+F	Find (Navigation)
Ctrl+K	Insert Hyperlink
Ctrl+X / Ctrl+C / Ctrl+V	Cut / Copy / Paste

Ctrl+H always replaces; Ctrl+F only finds.

Word Views and Review Tools

- ▶ **Print Layout** shows the document exactly as it will appear on the printed page.
- ▶ Other views: Web Layout, Outline, Draft.
- ▶ **Track Changes** records every insertion, deletion, and formatting edit.
- ▶ Each change can be **accepted or rejected** later.
- ▶ Track Changes also stores author and time as document metadata.

Trap alert

Track Changes does not delete the original text permanently. The original is preserved until a reviewer accepts or rejects the change (PYQ-12).

Word Trap Alert: Near-Neighbour Keys

- ▶ **Ctrl+H** opens Find and Replace; **Ctrl+F** opens Find only.
- ▶ **F7** is spell check; **Shift+F7** is the Thesaurus.
- ▶ **F1** is Help; **F2** renames (in File Explorer) or edits a cell (in Excel).
- ▶ **Ctrl+K** inserts a hyperlink, not a comment.
- ▶ One letter or one modifier changes the whole action.

Habit to build

Say the full action with the key: “F7 = Spelling & Grammar; Ctrl+H = Find and Replace.”

Word: Section Break vs Page Break

- ▶ A **Page Break** begins a new page but keeps the same section.
- ▶ A **Section Break** begins a new **section**.
- ▶ Only a **Section Break** allows a **different header or footer** on the following pages.
- ▶ Common wrong option: “Page Break changes the header/footer.” It does not (PYQ-13, TRAP-13).

Trap alert

Different headers/footers require a **Section Break**, never a Page Break.

PowerPoint: The Show Keys

Shortcut	Action in PowerPoint
F5	Start the slide show from the beginning
Shift+F5	Start the slide show from the current slide
Alt+F5	Start the presentation in Presenter View
Esc	End the running slide show

F5 begins; Shift+F5 resumes from here; Alt+F5 is Presenter View; Esc ends (PYQ-40).

PowerPoint Trap Alert: F5 Is Not Spell Check

- ▶ In PowerPoint, **F5** starts the slide show.
- ▶ In Word, **F7** is spell check; in PowerPoint too, F7 checks spelling.
- ▶ **F5** does **not** spell-check, and **F7** does **not** start a show.
- ▶ **Esc** ends the show; it does not go to the first slide.
- ▶ The same key can mean different things in different programs.

Trap alert

“F5 = spell check” is the classic near-neighbour trap. F5 starts the show; spell check is F7 (TRAP-32).

Handouts, Slide Master, Orientation

- ▶ **Handouts** print several slides per page for the audience, with optional note lines.
- ▶ **Handout Master** controls the handout and notes-page layout.
- ▶ The **Slide Master** controls the design, fonts, colours, and layout of **all slides** that use it.
- ▶ A change to the Slide Master propagates to every dependent slide.
- ▶ **Orientation** switches between **Portrait** and **Landscape**, for slides as well as for notes and handouts.

PowerPoint: SmartArt Conversion

- ▶ **SmartArt** turns text into a visual diagram (process, cycle, hierarchy, and more).
- ▶ A **bulleted list**, a **block of text**, and **indented text** can all be converted to SmartArt.
- ▶ A **table of data cannot** be directly converted to SmartArt.
- ▶ To move table data into SmartArt, the text must be copied into a text box first.
- ▶ Content type decides whether conversion is allowed (PYQ-17).

Trap alert

“Convert to SmartArt” is disabled for a table — a table is not a simple text string.

Excel: The Formula Palette

- ▶ A formula begins with **=**; without it, Excel treats the entry as text (PYQ-38, TRAP-30).
- ▶ The **formula palette** (the Insert Function dialog) helps you **build a formula**.
- ▶ It lists the function and shows each **argument** in its own box.
- ▶ It can be opened from the **fx** button beside the formula bar.
- ▶ It guides formula entry; it does not change cell size or data.

Definition

The formula palette is the dialog that lets you pick a function and fill its arguments while building a formula.

Excel: Cell References and the \$ Sign

Reference	Type	Behaviour when copied
A1	Relative	Both column and row change
\$A\$1	Absolute	Neither column nor row changes
\$A1	Mixed	Column fixed, row changes
A\$1	Mixed	Row fixed, column changes

The \$ sign “locks” the part that follows it. Press F4 while editing to cycle the reference type.

Excel Trap Alert: Locking and Starting a Formula

- ▶ **\$A\$1** is an **absolute** reference: the column and the row are both locked.
- ▶ **A1** is relative; it shifts when the formula is copied.
- ▶ A formula must start with **=**; **+** or **%** is not the formula marker (PYQ-38).
- ▶ **F4** toggles relative, absolute, and mixed references.
- ▶ **\$A1** and **A\$1** are mixed — only one part is locked.

Trap alert

A single \$ both locks a reference and can be forgotten — **\$A\$1** means the reference never moves when copied.

Product-Category Traps: Word, Excel, Access, MS-DOS

Program	Correct category
MS Word	Word processor (text documents)
MS Excel	Spreadsheet (cells, formulas)
MS Access	Database management system (tables, queries)
MS-DOS	Disk Operating System (command-line OS)

MS Access is a database, not a spreadsheet. None of Word, Excel, or Access is an operating system.

Word Feature Trap: Mail Merge

- ▶ **Mail Merge** combines a **main document** with a **data source** (such as an address database).
- ▶ It is a **Word** feature, used to produce many personalised letters, labels, or envelopes.
- ▶ It is **not** Track Changes, AutoCorrect, or a spell-check tool.
- ▶ Main document + data source = merged output (PYQ-37, TRAP-29).

Trap alert

“Combines letters with an address database” = **Mail Merge**. Do not confuse it with Track Changes.

Exact Shortcut Near-Neighbours: F1, F2, F5, F7

Key	In Word	In PowerPoint / Windows
F1	Help	Help
F2	Move text / edit field	Rename (File Explorer); edit cell (Excel)
F5	Go To	Start slide show (PowerPoint)
F7	Spelling & Grammar	Spelling (PowerPoint)

Ask “which program?” before you answer a function-key question.

Trap Alert: Terms to Keep Straight

- ▶ Word: **F7** = spell check; **Ctrl+H** = Find and Replace; **Ctrl+K** = hyperlink.
- ▶ Word: **Section Break** (not Page Break) gives different headers/footers (TRAP-13).
- ▶ PowerPoint: **F5** begins, **Shift+F5** from current, **Alt+F5** Presenter View, **Esc** ends (TRAP-32).
- ▶ PowerPoint: a **table** cannot convert directly to SmartArt.
- ▶ Excel: **\$A\$1** is absolute; a formula must start with **=**.
- ▶ Products: Word = word processor, Excel = spreadsheet, Access = database, MS-DOS = operating system.

Lesson 54: Recall

- ▶ Word keys: F7 spell check, Ctrl+H replace, Ctrl+K hyperlink, Ctrl+X/V cut and paste, Print Layout view, Track Changes for revisions.
- ▶ Section Break, not Page Break, enables different headers/footers.
- ▶ PowerPoint keys: F5 from the beginning, Shift+F5 from current, Alt+F5 Presenter View, Esc to end.
- ▶ Handouts print several slides per page; the Slide Master controls all slides; orientation is Portrait or Landscape.
- ▶ A table cannot be converted directly to SmartArt.
- ▶ Excel: the formula palette builds formulas; **\$A\$1** is an absolute reference.
- ▶ Product categories: Word processor vs spreadsheet vs database vs operating system.
