

Current Office, Email & Statement Evaluation

Lesson 61 — Advanced Statements and Near-Neighbour Traps

JKSSB Computer Awareness

October 8, 2026

Word: Structured Content and Content Controls

- ▶ A **content control** is a building block inserted into a document or template to build a structured form.
- ▶ Common types: plain text, rich text, picture, drop-down list, combo box, date picker, and check box.
- ▶ They are inserted from the **Developer** tab (enable it in Word Options → Customize Ribbon).
- ▶ A content control can **restrict editing** and enforce limited **data validation** (for example a drop-down list or a date picker).

One line

Content controls let a template allow only certain kinds of entry at a chosen spot in the document.

First-Line Indent vs Hanging Indent

Indent	What it shifts	Typical use
First-line indent	Only the first line of the paragraph	Normal paragraph openings
Hanging indent	Every line except the first (the first line hangs to the left)	References, bibliography, bulleted lists

These are paragraph-format settings; two paragraphs can use different indents even under the same style.

The Navigation Pane

- ▶ Open it from the **View** tab → Navigation Pane.
- ▶ It offers three views: **Headings**, **Pages**, and **Results** (search results).
- ▶ It is used to **jump** quickly to a heading or a page and to **search** the document.
- ▶ The Headings list is built from paragraphs that carry a **Heading style** (Heading 1, Heading 2, ...).

Trap

Reviewers' **comments** are read in the markup/comments pane, **not** directly in the Navigation Pane. (PYQ-12)

Track Changes and Its Metadata

- ▶ **Track Changes** records **insertions**, **deletions**, and **formatting** changes.
- ▶ Each recorded change stores the **author's name** and the **date and time**.
- ▶ **Accept** a change: it becomes final text and its revision metadata is **removed**.
- ▶ **Reject** a change: the original text is restored.

Remember

Accepting a change keeps the new text but strips the author metadata attached to that change. (PYQ-12)

Section Break vs Page Break

Break	What it does	What changes
Page Break	Moves text to the next page	Nothing: same section, same headers and margins
Section Break	Starts a new section	Each section can have its own headers/footers, margins, orientation, columns, numbering

Trap

Different headers and footers in one document require a **Section Break**, **not** a Page Break. (PYQ-13, TRAP-13)

Excel: The Nested IF

- ▶ An **IF** returns one of two values: `=IF(condition, value_if_true, value_if_false)`.
- ▶ A **nested IF** places another IF in one of those two positions.
- ▶ `=IF(A1>50,"High",IF(A1>25,"Medium","Low"))`
- ▶ The **first** condition that is TRUE decides the result; testing stops there.

Worked example

A1 = 70 → High; A1 = 30 → Medium; A1 = 10 → Low.

Blank and Non-Numeric Input in IF

- ▶ In a numeric comparison, a **blank cell is treated as zero**.
- ▶ So =IF(A1>50,...) with A1 blank takes the **FALSE** branch, because 0 is not greater than 50.
- ▶ Non-numeric **text** is not a number: arithmetic on it gives #VALUE!, and ISNUMBER returns FALSE.
- ▶ Guard the formula with **ISBLANK**, **ISNUMBER**, or **IFERROR** when the cell may be empty or text.

Trap

A blank cell does **not** make IF stop or error — it is read as 0. (PYQ-14)

COUNTIFS: Multi-Criterion Counting

- ▶ **COUNTIFS** counts the rows that satisfy **all** the given conditions (AND logic).
- ▶ Form: COUNTIFS(range1, criteria1, range2, criteria2, ...).
- ▶ All ranges must be the **same size**.
- ▶ Use **COUNTIF** (singular) for one condition; **COUNTIFS** (plural) for several.
- ▶ Text criteria may use the wildcards * and ?.

Example

=COUNTIFS(A2:A20,"Sales",B2:B20,">1000") counts the Sales rows above 1000.

SUMPRODUCT: Products and Counting

- ▶ **SUMPRODUCT** multiplies corresponding elements of the arrays and returns the **sum of the products**.
- ▶ $\text{=SUMPRODUCT}(A1:A3, B1:B3) = A1*B1 + A2*B2 + A3*B3$.
- ▶ With boolean arrays it can also **count**:
 $\text{=SUMPRODUCT}((A1:A10>50)*(B1:B10=\text{"Yes"}))$ counts rows meeting both conditions.

Trap

COUNTIFS takes several criteria; **SUMPRODUCT** does **not** “only add” — it can count multi-criterion rows as well. (PYQ-15, TRAP-14)

Email Filters and Rules

- ▶ A **filter** (called a **rule** in Outlook) acts **automatically** on incoming or outgoing mail.
- ▶ It checks **conditions**: sender, recipient, subject, keywords, attachments.
- ▶ It performs an **action**: move to a folder, flag, forward, delete, or mark as read.
- ▶ Typical use: route mail from one sender into a dedicated folder.

One line

A rule = a condition plus an action, applied automatically to mail.

Digital Signature vs Encryption

Point	Digital signature	Encryption
Purpose	Authenticity and integrity	Confidentiality
What it proves	Who sent it, and that it was not altered	Only the intended reader can read it
Hides the content?	No	Yes

Trap

A digital signature does **not** encrypt the message body. It verifies the sender and detects tampering. (PYQ-16, TRAP-15)

POP3: Post Office Protocol version 3

- ▶ **POP3** stands for **Post Office Protocol version 3**.
- ▶ It **downloads** mail from the mail server to the **local** device.
- ▶ By default it typically **removes** the mail from the server, so it is not kept in sync across devices.
- ▶ **IMAP** keeps mail on the server and syncs all devices.

Trap

SMTP sends mail; **POP3** receives (downloads) it. POP3 does **not** keep mail synced on the server. (PYQ-16, TRAP-17)

BCC and Recipient Privacy

- ▶ **To**: the primary recipients — visible to everyone.
- ▶ **Cc** (Carbon Copy): copied recipients — visible to everyone.
- ▶ **Bcc** (Blind Carbon Copy): the addresses are **hidden** from the other recipients.
- ▶ The **sender** always sees all recipients; a Bcc recipient cannot see the other recipients.

Trap

Bcc hides recipients from **each other**, **not** from the sender. (PYQ-16, TRAP-16)

PowerPoint SmartArt Conversion

- ▶ Convert a **bulleted list** of text into SmartArt: **Home** tab → Convert to SmartArt Graphic.
- ▶ Convert SmartArt **back to text**: SmartArt Tools Design → Convert → Convert to Text (you get a bulleted list; shapes and pictures are lost).
- ▶ **Convert to Shapes** breaks the SmartArt into ordinary shapes; after that it **cannot** be turned back into SmartArt.

Remember

The direct source of “Convert to SmartArt” is **text**, so a picture or a chart is not converted to SmartArt in one step. (PYQ-17)

Trap Alert: Near-Neighbour Distinctions

- ▶ Headers/footers → **Section Break**, not Page Break.
- ▶ Hanging indent shifts **every line except the first**.
- ▶ Blank cell in a comparison = **0**, not an error.
- ▶ **COUNTIFS** = several criteria; **SUMPRODUCT** can add and count.
- ▶ **Digital signature** $\neq$ encryption.
- ▶ **POP3** downloads; **IMAP** syncs.
- ▶ **Bcc** hides recipients from each other, not from the sender.

Lesson 61: Recall

- ▶ A **content control** structures a template and can restrict entry; it is inserted from the **Developer** tab.
- ▶ A **first-line** indent shifts the first line; a **hanging** indent shifts every line except the first.
- ▶ The **Navigation Pane** jumps by headings, pages, or results; comments are **not** shown there.
- ▶ **Track Changes** stores author and time; accepting a change removes that change's metadata.
- ▶ **Section Break** (not Page Break) allows different headers and footers.
- ▶ A nested **IF** returns the first TRUE branch; a **blank** cell is read as 0.
- ▶ **COUNTIFS** counts with AND logic; **SUMPRODUCT** multiplies and can count.
- ▶ **Digital signature** = authenticity; **encryption** = confidentiality; **POP3** downloads; **Bcc** hides recipients.
- ▶ SmartArt converts from text and back to text; shapes cannot revert to SmartArt.
