

Lesson 66 Practice: Answers and Rationales

JKSSB Computer Awareness

October 10, 2026

Provenance: All 25 items are original exam-pattern questions (*[Original]* plus the *[JKSSB FAA-pattern]*, *[JKPSI-pattern]*, *[SSC CGL-pattern]*, and *[JKSSB-pattern]* extension items, including MSQs); none reproduces an official paper item.

- Q1. A.** F5-from-beginning is stable recall inside the JA scope and version-free, so it is Core-General. Current-General (B) needs a refreshable instance; Technical-Post (C) needs engineering depth; Version-Sensitive (D) needs a version-dependent answer.
- Q2. C.** Fractional binary conversion is a computation drill from the technical papers, so it is Technical-Post. Core-General (A) covers stable recall without computation; Current-General (B) covers refreshable instances; D is wrong because version-sensitivity is a flag, not a substitute tag.
- Q3. B.** The concept (virus protection) is stable but the instance changes each cycle, so it is Current-General. Core-General (A) would need a version-free stable fact; Technical-Post (C) needs engineering depth; D is wrong because the annexure scope names virus and anti-virus.
- Q4. D.** A menu-location claim with no stated Office version is Version-Sensitive and under-specified, so it is flagged rather than memorised. The other tags (A, B, C) each assert the item is answerable as stated, which it is not.
- Q5. C.** The JA final key settles disputed JA items; Tier 1 outranks all lower tiers. A bank key (A), a tutorial (B), and a textbook treatment (D) never overrule the official final key.
- Q6. C.** A Tier-2 bank never overrules a Tier-1 final key, so C is the NOT-true statement. A states the precedence rule correctly; B states the proper Tier-2 use; D states the Tier-3 limit correctly.
- Q7. A.** ISP stands for Internet Service Provider. B, C, and D are not the correct full form.
- Q8. A.** I and II are correct: the provisional key can change and the final key settles disputes. III is false because Tier 2 never overrules Tier 1. B and C each include false III; D includes false III.
- Q9. C.** SRC-06 is the JA 2026 final answer key. A is wrong because SRC-03 is the JA paper, not CI; B is wrong because SRC-05 is the CI paper, not JA; D is wrong because SRC-08 is the CI final key, while the WO provisional key is SRC-07.
- Q10. C.** A tab location depends on the Office version, so it is version-sensitive and must be tied to a stated version. The bit (A), Mail Merge (B), and RAM volatility (D) are stable version-free facts.

- Q11. B.** POP3 downloads to the local machine while IMAP syncs across devices. A reverses both behaviours; C claims they are identical; D misclassifies both protocols as unrelated software.
- Q12. C.** IPv6 is 128-bit. A gives the IPv4 size; B and D are not the IPv6 address size, and 256-bit is a planted distractor.
- Q13. A.** A digital signature provides authenticity and integrity while encryption provides confidentiality. B swaps the two roles; C claims they are identical; D describes compression and deletion.
- Q14. C.** A JA candidate drilling the full CI computation block as if JA tested it is the over-generalisation error. A describes correct JA routing; B describes correct CI routing; D describes a correct key-checking habit.
- Q15. B.** The workflow order is collect Tier 1, tag items, diff keys, screen versions, route by post. A, C, and D scramble that dependency order (tagging before collecting, or routing before tagging).
- Q16. B.** The final key wins; the stem wording is flagged as disputed and the stable concept is taught. A memorises the superseded provisional answer; C appeals to a lower tier; D abandons the topic instead of auditing it.
- Q17. B.** Generated items carry *[Original]* with no paper claim. A presents a generated item as a verbatim PYQ; C mislabels a bank-derived item as a PYQ; D assigns an exact PYQ number from memory to a paraphrase.
- Q18. A.** BCC hides recipients from each other while To/Cc stay visible and the sender always knows. B wrongly hides the message from the sender; C confuses BCC with forwarding and deletion; D confuses addressing with encryption and signatures.
- Q19. A.** F5 starts a slide show from the beginning. F7 (B) is spell check, F9 (C) is unrelated recalculation/refresh usage, and Shift + F1 (D) is not the from-beginning command.
- Q20. A.** A formula must start with =. +, %, and # (B, C, D) do not open a formula.
- Q21. A.** Traceroute traces packet hops. B, C, and D are unrelated local actions.
- Q22. A.** Routers join networks. B, C, and D are peripherals, not forwarding devices.
- Q23. A.** MAC addresses label network interfaces. B, C, and D are non-network items.
- Q24. A, B, C.** The router, traceroute, and firewall facts are correct. D is false: printers do not route packets.
- Q25. A, B, C.** The IP, MAC, and port identities are correct. D is false: IPs never encode ink colour.
- Q26. A.** A PYQ claim requires a traceable paper identity/source. Similar style or plausibility does not establish provenance.
- Q27. A.** The official final answer key is authoritative over a secondary transcription or generated explanation.

- Q28. A.** A newly authored multi-select item is an original MSQ drill. It must not imply the source exam used that format.
- Q29. A.** Useful provenance identifies the paper/item and answer-key status. Topic or difficulty alone cannot establish authenticity.
- Q30. A, B, C.** The first three preserve provenance. Exam-style similarity does not make an item an authentic PYQ.
